SUPERTEAM EARN · BEST USE OF METEORA DBC

DBC Config Lab

Design, simulate and deploy Meteora Dynamic Bonding Curve launch configs — and see who wins and who pays before a single token goes live.

github.com/LimeFox0013/dbc-config-lab · open source

THE PROBLEM

A DBC config is set once and lives with its rules forever.

Curve shape, fee schedule, graduation threshold, liquidity locks — get them wrong and bots take the first seconds while real buyers pay. Today builders choose these numbers blind, or copy another launchpad.

THE ENGINE

A whole launch, replayed with Meteora's own swap math

Seeded traders — first-second snipers, patient bots that wait for fees to fall, human buyers, arbitrage traders — trade the bonding curve through the DBC SDK, then the DAMM v2 pool it graduates into through the DAMM v2 SDK.

8	386	7	970
real mainnet launches replayed	bonding-curve swaps	graduations	swaps after graduation

Every fee, amount and price matches the chain exactly — with a read-only script anyone can rerun.

FINDING · SNIPERS

A short, steep fee window beats first-second snipers

Fee schedule	Sniper profit	Human profit	Partner + creator
Flat 1%	+0.85 SOL	−2.30 SOL	0.67 SOL
90% → 1% over 5–10 s	−6.8 to −7.7	≈ −1.78 SOL	6.3–7.1 SOL
50% → 1% over 60 s	−5.7 SOL	−2.98 SOL	6.45 SOL

Humans end better off than under a flat fee. But **patient bots that wait out the window defeat every schedule** — the lab says so instead of hiding it.

Typical launch: 5 snipers buying 1–3 SOL in the first 2 s, 60 humans over ten minutes; mean of 20 seeded runs.

FINDING · TOKENIZED STOCKS

Open a tokenized name near its outside price

139 SOL

to arbitrage traders on a meme-style curve opening near 20 SOL — and it never graduates

12 SOL

on the built-in stock preset, opening at 83% of the outside price

-0.4 SOL

recommended: open at 95%, graduate at 98%, fee 50% → 1% over 30 s — graduates every launch in ~2 min

Ask the recommender for "price close to an outside price" and it searches curves placed around that price for you.

Tokenized-stock situation: 3 arbitrage traders know a 300 SOL outside market cap; mean of 10 seeded runs.

FINDING · REAL LAUNCHPADS

The 200 most-graduated launchpad configs on mainnet, read from chain

199 of 200

leave graduation liquidity that can be withdrawn

61

lock under 10% — the program no longer accepts them as they are

133

earn nothing after graduation: the curve is all they earn

9 of 55

measurable ones earn more after graduation than on the curve

Snapshot read 2026-10-03 from each config's pools; after-graduation income from the positions fee wallets hold (quote-token fees).

THE LAUNCHPAD KIT

From a goal to a live launchpad, in one tool

Compare
any configs, one trader situation

→

Recommend
8 goals or your own weights

→

Edit · clone
checked by the program's rules

→

Deploy
your wallet, dry run first

→

Launch page
creators launch with a first buy

Then: claim partner and creator fees, watch every config a fee wallet earns from, forecast income from comparable real launchpads, and sell presets as on-chain royalties.

FOR TRADERS, TERMINALS AND AGENTS

Every config's risks, readable by people and machines

Config report

`/config/<address>`

No wallet. Withdrawable liquidity, kept mint authority, no auto-graduation, retired terms — plus real and simulated launches, labelled apart.

Data feed

`/data/launchpads/index.json`

The report for all 200 launchpads as JSON any terminal can fetch, from any origin, no key.

MCP server

`6 tools over stdio`

Agents compare, recommend, read reports, search launchpads and export SDK code. Read-only: signing stays in the user's wallet.

DEPTH OF METEORA INTEGRATION

Built on three Meteora programs, end to end

Meteora	What the lab does with it
DBC SDK	Builds all four curve shapes, simulates every swap, creates configs, launches tokens with a first buy, claims partner and creator fees, publishes partner branding
DAMM v2 SDK	Simulates the graduated pool exactly: compounding liquidity, its volatility fee, a fee that falls as the price rises, liquidity pulls
Dynamic Fee Sharing	Preset royalties: a vault splits every fee claim between the launchpad and the preset's author, on chain

Priced in SOL or USDC, and checked against Meteora's migration-keeper minimums.

TECHNICAL EXECUTION

Every figure simulated, never generated — and checked

21/21
live devnet check: deploy, launch, swaps match the simulator

3/3
mainnet configs cloned byte-identical on devnet

Exact
royalty split verified on devnet to the lamport

402 + 74
unit and browser tests in CI, plus a container smoke test

2 reviews
manual security reviews: no critical or high findings

MIT
open source, limits stated in the README

See it before you launch it.
